

A good outcome.

Announcing the Low-base Option for the Rifton TRAM

The Rifton TRAM, our award-winning transfer and mobility device that combines seated transfer, sit-to-stand liftand gait training, was launched a year ago in July. Since then it has gained wide adoption in all kinds of clinical settings from schools to rehab hospitals to skilled nursing facilities and beyond. So when acute-care professionals told us they needed a lower profile base to fit under ICU and SNF beds, we listened.

The solution was clear – develop a new base that would enable early mobilization protocols. We think the result is a good outcome for both patients and professionals.

Available June 2013

The low-base TRAM with a 3" caster and lower frame base, does everything the standard Rifton TRAM does, plus it slides under beds with a 4.25" clearance. Operable by just one staff member, the low-base TRAM will be able to transfer an acute-care patient out of bed and into a standing position, then support partial or even non-weight-bearing ambulation to achieve early mobility.

You ask, we listen.

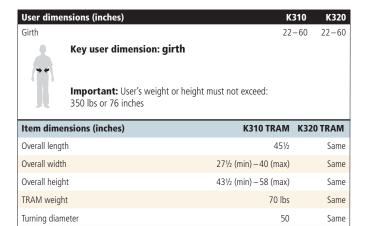

Rifton TRAM

How to Buy

- 1. Select the frame model (standard or low-base). Then choose between scale or no scale version. Each includes two thigh straps, one battery, one battery charger and Rifton accessories tote.
- 2. Choose a power supply cord.
- 3. Select additional accessories as your needs require.
- 4. Add up the total cost and place your order.
- 5. Call us any time at 800.571.8198 if you need assistance. We're always here to help.

The standard TRAM remains the best choice for gait training; its 4" casters enable it to roll smoothly over most surfaces. But with either the standard or low-base TRAM, gait training distance and duration are determined by therapeutic practice and patient ability alone, unhampered by the restrictions of tracking systems or personnel availability.
